EMAC® Group is a leader in **solutions for joining diverse materials** that come into play in a construction project. Its wide range of **technical and decorative profile solutions, technical entrance mats, structural and expansion joints, along with universal accessibility and safety solutions** encompass floors, walls, façades and urban paving, all delivered with immediate service, unique to its sector.

EMAC® Group is a **key multinational** group comprising various companies with a footing in both national and international markets. It is present in over 110 countries, with **subsidiaries in the USA and Italy** to provide EMAC® solutions to the world's most demanding markets.

Following EMAC® Group's commitment to sustainability, we have developed an **Environmental Product Declaration (EPD)** for our aluminium products, giving us thorough knowledge of our products' life cycle analysis (LCA).

Applications

This Declaration is a sector EPD. A sector EPD represents several manufacturers.

The applications of this EPD are aluminium solutions to be used mainly in **building and construction products such as profiles**, windows, doors, curtain walls, façade systems, skylights, awnings, etc.

Product

The products covered by this EPD are extruded aluminium profiles belonging to the families of both **anodised and lacquered profiles**.

Objective and Scope

This EPD **assesses the environmental parameters of the life cycle analysis (LCA) and life cycle inventory (LCI)** of aluminium profiles manufactured by Spanish Aluminium Association (AEA) members from **cradle to door** with options (final disposal).

This EPD is the basis for B2B communications and can be used by all interested third parties within the construction sector.

Verification

This EPD is verified pursuant to **standard ISO 14025** under the requirements set forth by the basic product category rules for **construction products 15804:2012+A2:2019** and by the general rules of the **International EPD® System** programme. The results shown in this EPD are based on the LCA Report for Sector EPD by the Spanish Aluminium Association (AEA) dated 12 April 2020 according to standard **ISO 14044**.

The verification of this EPD has been undertaken by the external company **Centro Tecnológico de Miranda de Ebro.**

Validity

With the support of our technological partner, Instituto Tecnológico del Embalaje, Transporte y logística (ITENE) we have obtained validation from the **sustainable construction certification companies LEED and BREEAM** which confirm that this EPD is valid, taking into account that it must be **specified** that this is **information based on average sector values** and that in no case can it be reported that the sector EPD exactly represents a unique, concrete product.

ABOUT AEA

The Aluminium Spanish Association (Asociación Española de Aluminio – AEA) is a non-profit association that represents the Spanish aluminium industry and watches over the defense of its global interests.

The AEA is composed of 89 members, including extruders, lacquers and anodizers, as well as suppliers of quality services and raw materials such as primary and secondary aluminium, powder coating, thermal bridge break profiles (TBB) and chemical products for surface treatments.

The information in this document is based on data supplied by 12 AEA member companies who have produced a comprehensive industry-wide environmental product declaration (EPD) for anodized and coated aluminium profiles. The data comes from 17 separate production facilities, with a total of 38 extrusion presses, 13 anodizing lines, 20 coating lines and 1 cast house that produces secondary extrusion billet starting from post-industrial and consumer aluminium scrap. 3 of these 12 companies have own cast house to recycle the post-industrial aluminium scrap produced in their installations. Two manufacturers of polyamide profiles (TBB) and a manufacturer of chemical products (used in anodizing and coating) have also participated in the generation of the inventories. In aggregate, the data-contributing installations have a production capacity of more than 280.000 ton of aluminium profiles, about 74% of total AEA production and 62% of the total Spanish production.

PRODUCT

Product description

This EPD covers a wide range of aluminum extrusion products manufactured by AEA members in Spain, not considering a burden for scrap or credit for the EoL (End of Life) . The products considered in this declaration are as follows:

- Anodized aluminium profile

- Coated aluminium profile

- Thermal break anodized aluminium profile

- Thermal break coated aluminium profile

It excludes downstream fabrication operations such as machining and assembly due to the wide diversity of such operations.

The results are an average representative of all aluminium profiles produced for AEA members. Averages are obtained through aggregating production-weighted data from the participating companies. For this reason, EPD covers average values and declared products are an average that is not available for purchase on the market.

Applications

Aluminium profiles are primarily used in building and construction applications, including windows, doors, curtain walls, façade systems, skylights, canopies, etc.

Technical data

Technical data is representative of 6000 series aluminium alloys (6xxx alloy, tempers T1-T6), which is the predominant production of the participants.

Composition

Aluminium profiles can be produced as standard or customer design so there is a wide variety of profiles. Therefore, the composition of the final product can also be very different between designs. This EPD covers four product groups with an average composition as shown below. The product does not contain any substance included in the list of Substances of Very High Concern with concentrations higher than 0.1% in weight.

Packaging

Aluminium profiles are packaged using lumber, plastic film, plastic strapping and cardboard. Packaging is often per customer specification. All packaging materials are recyclable and/or reusable following delivery to the customer. Packaging materials are included in the scope of this EPD (in A1 module); packaging disposal and raw materials packaging, however, are outside the scope.

Property	Value	
Young's modulus	68 - 80 GPa	UNE-EN ISO 6892
Yield strength (elastic limit)	95 - 610 Mpa	UNE-EN ISO 6892
Tensile strength	180 - 620 Mpa	UNE-EN ISO 6892
Hardness - Vickers	60 - 160 HV	UNE-EN ISO 6507
Fatigue strength (10^7 cycles)	57 - 210 Mpa	UNE 7118
Density	2550 – 2900 kg/m^3	
Melting point	495 - 640 °C	
Thermal conductivity	118 - 174 W/m.°C	
Specific heat capacity	890 - 1020 J/kg.°C	

The biogenic carbon contained in the wood and cardboard used in the packaging represents a total of 0.023 kg per each kilogram of aluminium profile.

Reference service life and use phase

Service life for products will vary depending on the final application, but is typically long due to aluminium´s high corrosion resistance. It can accept a service life of 50 years according to bibliography. Similarly, further processing (other than anodizing, coating, or thermal improvement), assembly and/or installation of extruded aluminum products are outside the scope of this EPD.

Recycling and disposal

Aluminium products are highly recyclable. During aluminium profile production, all post-industrial scrap (extrusion drop-offs from cutting, unfit material and discards, etc.) is fed back into the billet production process. Even some AEA members operate their own scrap smelting facilities in addition to purchasing billet from external secondary smelters or from primary aluminium manufacturer.

In the same way, when an aluminium building product reaches the end of its life, it is systematically and selectively collected and sent to recycling facilities for secondary billet production. A collection rate for aluminium products next to 95% is well documented in construction sector.

	ANODIZED PROFILE	COATED PROFILE	THERMAL BREAK ANODIZED PROFILE	THERMAL BREAK COATED PROFILE

Plastic Film	0.010kg - 1.0% (*)			
Biogenic carbon	0.023kg C			

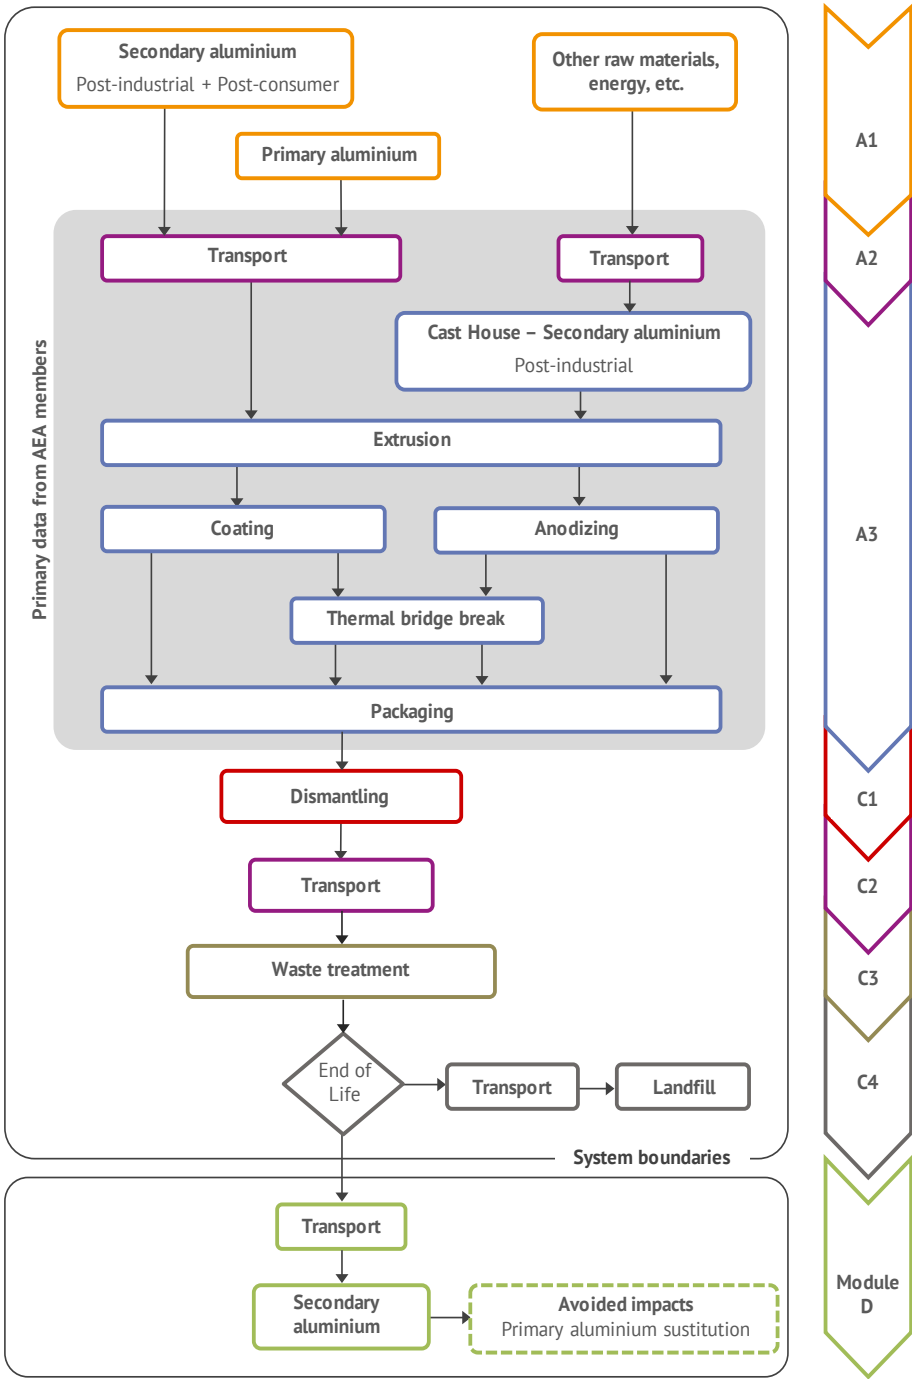
(*) Versus product

In both cases recycling rate depends on smelting yield that includes metal losses during scrap preparation and melting. Smelting yield is highy influenced by the presence of non aluminium material (as TBB and/or coating) and the origin of the scrap (post-industrial or post-consumer).

Hence, aluminium supply at the beginning of the product system has a content of recycled material from post-industrial and post-consumer scrap with the consequent reduction of environmental burdens. In module D are reported only the net benefits of recycling, i.e. the recycling benefits at the end of life minus the benefits already considered in the module A1 due to secondary aluminium content. In this EPD, the scrap not collected at the end of life is sent to landfill. The average metal composition, based on metal feedstock information collected from the companies participating in this EPD, is shown in the composition table.

System boundaries

The scope of the study is set to be "Cradle-to-gate with options". Processes included in the assessment are presented on the diagram below.



LCA INFORMATION

Declared unit

The declared unit is the production of 1 kg of aluminium profile for construction use including the surface treatment (coating or anodization) and the optional thermal bridge break.

To obtain the environmental information referred to a 1 meter of profile, conversion factors are provided for 4 products: anodized profile, 0.592 kg/m; thermal break anodized profile, 0.550 kg/m; coated profile, 0.576 kg/m; and thermal break coated profile, 0.534 kg/m.

Goal and scope

This EPD evaluates the environmental impacts of 1 kg aluminium profile product from cradle to gate with option (disposal). This EPD is the basis for B2B communication. Intended use clients and relevant stakeholders within the building sector.

System boundaries

This EPD provides information on the production stage of the aluminium profiles (raw material supply, transport to plants and manufacturing) and their end-of-life. Recycling potential of aluminium with burdens saving due to use in a second product systems is also reported. The information is presented in a modular way separated in the following stages.

Stage	Production			Construction		Use							End-of-life				Resource recovery
Module	Raw materials supply	Transport	Manufacturing	Transport	Installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	De-construction	Transport	Waste processing	Disposal	Reuse, recovery or recycling potentials
	A1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4	D
Declared module	X	X	X	ND	ND	ND	ND	ND	ND	ND	ND	ND	X	X	X	X	X
Geography	EU	EU	EU	-	-	-	-	-	-	-	-	-	EU	EU	ES	EU	EU
Specific data	94.3%			-	-	-	-	-	-	-	-	-	-	-	-	-	-
Variation - products (1)	+12.8% / -7.6%			-	-	-	-	-	-	-	-	-	-	-	-	-	-
Variation - plants (2)	+12.8% / -7.6%			-	-	-	-	-	-	-	-	-	-	-	-	-	-

(1) Maximum variation for all declared products - (2) Maximum variation for all manufacturers
ND - Not declared

A1-3 - Cradle to gate

The aggregation of the modules A1, A2 and A3 is allowed by EN 15804. This rule is applied in this EPD and denoted by A1-3. This module represents the extraction and processing of raw materials, the transport to production sites and the manufacture and packaging of profiles.

C1 - De-construction

No information was found in the life cycle databases consulted for the dismantling operations of elements such as windows or external doors, nor was there a bibliography regarding the inputs or residues generated during these operations.Then, there is no contribution on impact categories of this module.

Parameters, C2 module	
Transport by road [1]	Lorry, 17.3 t max payload
Diesel consumption (l/km)	0.221
Distance (km)	200
Volume capacity utilization	100%
Mass capacity utilisation	67%

(1) Technology mix, Euro 0, 1, 2, 3, 4

Parameters, C3 module	
Energy carrier	Electricity, low voltage {ES}
Consumption (kWh/kg)	0.0245
Waste (landfill)	0.05 kg

C2 - Transport to waste processing

A distance of 200 km has been assumed for the transport to scrap dealers. Transport is calculated on the basis of a scenario with the parameters described in the attached table.

C3 - Waste processing for reuse, recovery and/or recycling

It has been assumed that during the scrapping operations the same electricity is consumed as during the assembly of a window of 1.23 mx 1.48 m with a profile thickness between 45 and 70 mm.

C4 - Final disposal

Recovery rates for aluminium during building dismantling are modelled based on figures reported by the European Aluminium Association (see references). It was assumed a 95% for recovery rate while the remaining 5% goes to landfill.

D - Allocation by reuse, recovery or recycling

Scrap inputs to the production stage are subtracted from scrap to be recycled at end of life in order to obtain the net scrap output from the product system. This remaining net scrap is then sent to recycling. Module D report the environmental aspects of recycled scrap generated at the end of life minus that used at the production stage. Loads and benefits are assessed at the point of functional equivalence, i.e. where the substitution of primary aluminium takes place. In the recycling process, smelting yield for each scrap fraction was taken into account.

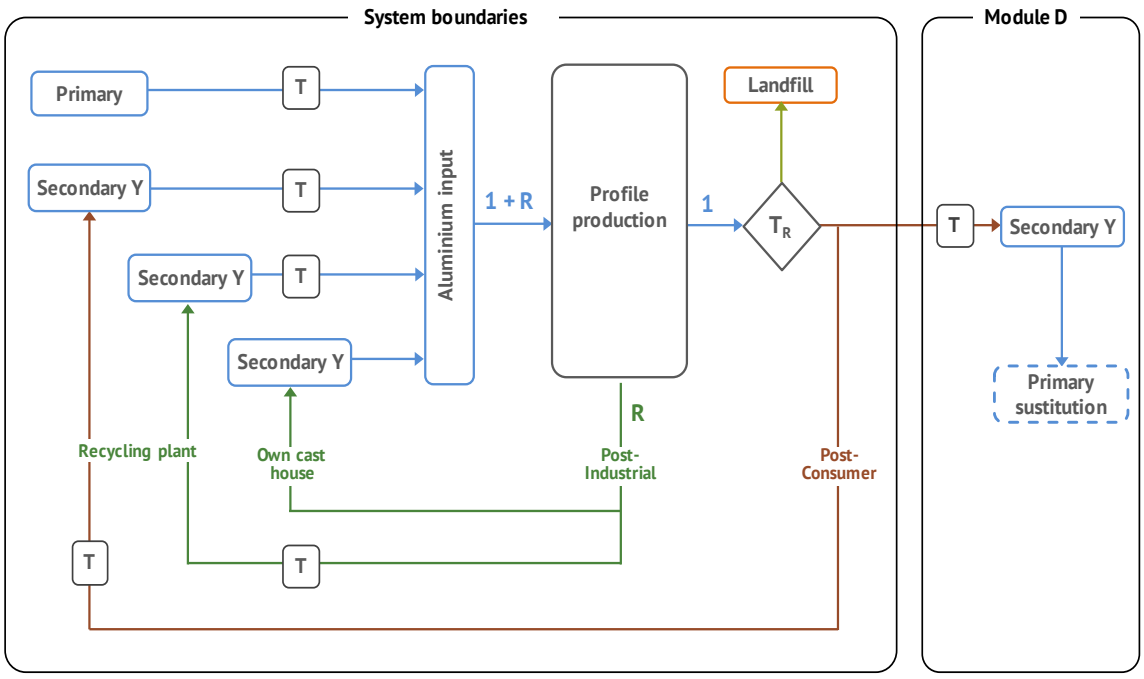
In order to make the results tables lighter, will be shown only declared modules with a non-zero contribution to the impact categories declared in this EPD.

Time representativeness

All primary data used in this EPD are based on the 2017 production data for aluminium profiles manufactured by AEA members in their facilities in Spain.

Database(s) and LCA software used

The data for primary aluminium billet and for scrap remelting (secondary aluminium billet) are based on LCI dataset published by European Aluminium in february 2018 and are the best available. For transport processes the ELCD 3.2 database was consulted. Other LCI datasets were sourced from the Ecoinvent v3.3.



R – Process losses T_R – Recovery Rate Y – Smelting yield T - Transport

The LCA study was performed using an excel-based model. The impact assessment results were calculated using characterization factors from EC-JRC available at http://eplca.jrc.ec.europa.eu/LCDN/developerEF.xhtml.

Data Quality

In order to achieve precision, consistency and representativeness and to ensure reliable results, first-hand industry data were used. All foreground data were collected from AEA participating companies for their facilities using customized data collection templates. It was created representative production-weighted inventories. These inventories are intended to represent average of aluminium profile production for building by AEA members. The age of these data is less than two years. As for bibliographic data, none has been used with a year of publication lower than 2011.

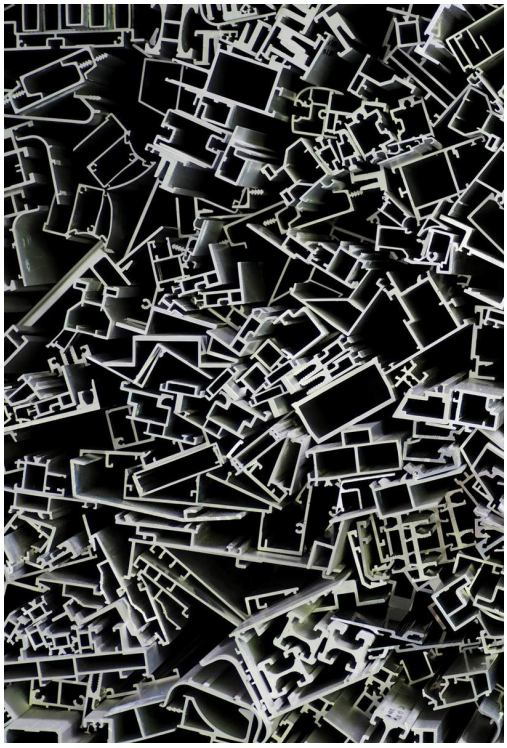
Regionally specific datasets were used to model the energy consumption (electricity, natural gas or diesel). For the processes of transport, production of raw materials or end-of-life, datasets were chosen according to their technological and geographical representation of the actual process. The technological and geographical representativeness of 76% of the processes included in the LCA is guaranteed, among which are the most contributing to final results. For 18% of the processes, only geographical or technological representativeness is guaranteed. For the rest of the processes, proxy datasets were used to address the lack of data for a specific process or for a specific geographical region.

Estimates and Assumptions

The activity data was obtained from inventories that were completed by all the participating companies based on their data on production, consumption of raw materials and energy, and the generation of waste, effluents and emissions. From these inventories, a unitary process was generated for each manufacturer and for each of the phases of the profile manufacturing process. Finally, the unit processes that support this EPD were obtained from the weighted average of the unit processes of all manufacturers for the same phase of the manufacturting process.

The maximum and minimum values for module A1-3 have been obtained from the individual evaluation for each of the manufacturers that have provided inventories. In those cases in which the manufacturers could not complete all

the environmental aspects that have been included in the calculation of the impacts, the weighted average value of these environmental aspects has been used. In this way, the integrity of all inventories is guaranteed, making the comparison between them more consistent with the ultimate aim of obtaining maximum and minimum values. At this point it is noteworthy that in most cases, the inventories provided by manufacturers present the most relevant environmental aspects (consumption of energy or main raw materials), being necessary to complete them with those with a lower incidence on the final result.



It was not possible to distinguish the consumption of electricity and natural gas between the production stages of profiles. Based on the total energy consumption in the plants, electricity and natural gas used in the different stages was estimated under the criteria of the technical staff of plants. Total energy consumption was attributed entirely to extrusion, coating, anodizing and cast house. The contribution of packaging and thermal bridge break to electricity consumption is not relevant (but it is included in the rest of processes).

Once the energy consumption was attributed to extrusion, coating, anodizing and cast house, it was apportioned among the total production of semi-finished products for each stage. It has proceeded in the same way for raw materials and waste generation.

Because tens of different chemicals are used for surface treatments before anodizing and coating, their consumption were modeled based on the surface of an average profile. The surface treatments chosen are the most complete and those that require the use of the greatest amount of chemicals per square meter of treated surface, thus attending to a conservative assumption.

Billets are made from 100% primary aluminium or nearly 100% secondary aluminium (from post-industrial and post-consumer scrap). Billet manufacturers have provided production data for both in order to calculate the recycled content in the aluminum input to the product system.

All scrap was modeled as burden free when entering the system but it was included transport to the recycling sites for post-industrial scrap from AEA members.

EPD updating

New standard EN 15804-2012+A2:2019 has meant important methodological changes in the development of EPD of construction products that have led to the writing of new PCR by the International EPD® System. For this reason, AEA, which is making a decisive commitment to environmental innovation, has faced the update of its sector EPD of aluminium profiles.

The main change made in this update has been the declaration of the new list of indicators, basic and additional. These changes affect the number of these indicators, the new units in which some of them are expressed and the new characterization factors applied. Although the environmental indicators cannot be compared between different versions of the EPD, especially when there are such deep changes between them, a reduction in impacts such as climate change or energy parameters has been observed.

As it is a sector EPD, the maximum and minimum variation of all indicators has been declared. This range contains the variation due to the different products represented by average product, and due to the different production facilities included in the study. Another issue of interest in the update is that packaging components of the profiles, and their biogenic carbon content, have been declared.

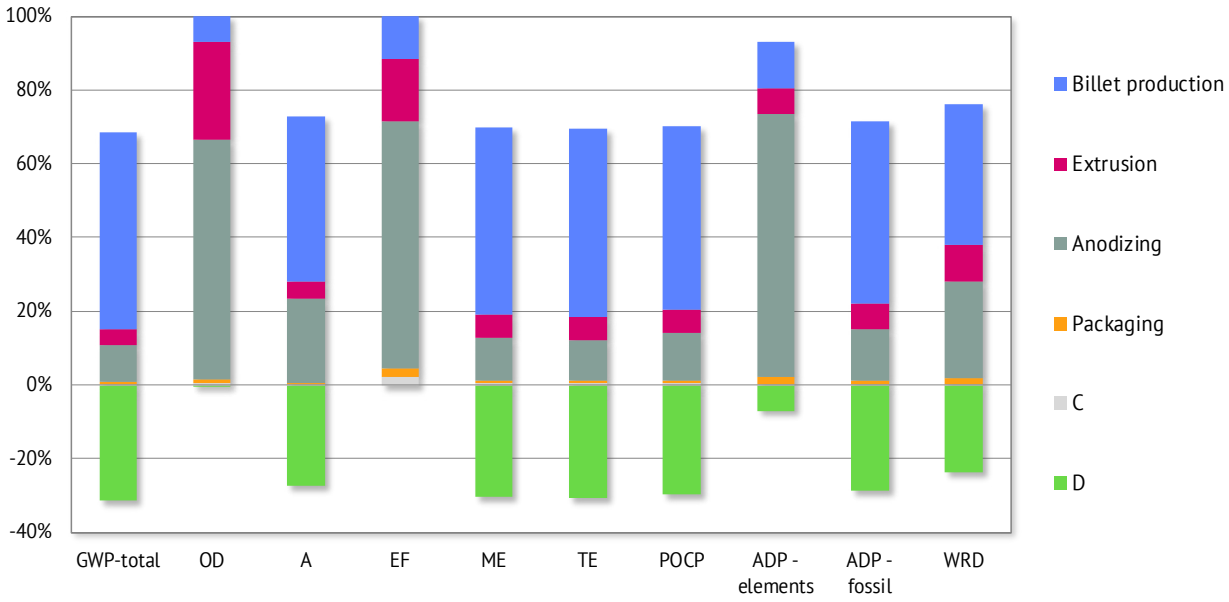
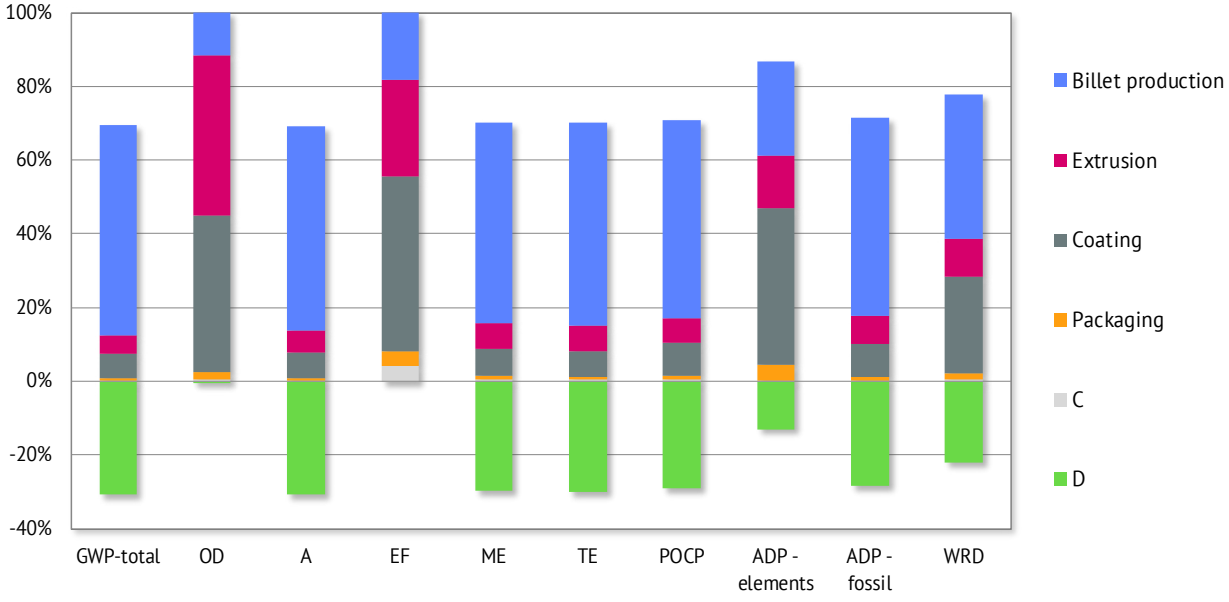
SUPPLEMENT INFORMATION

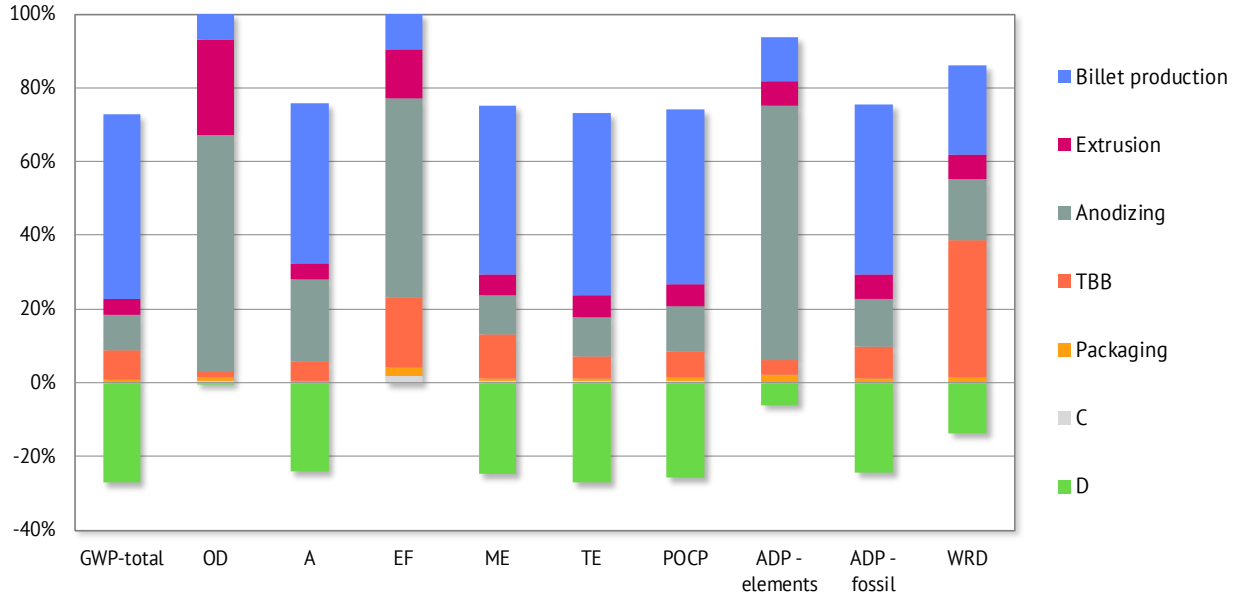
ANODIZED ALUMINIUM PROFILE



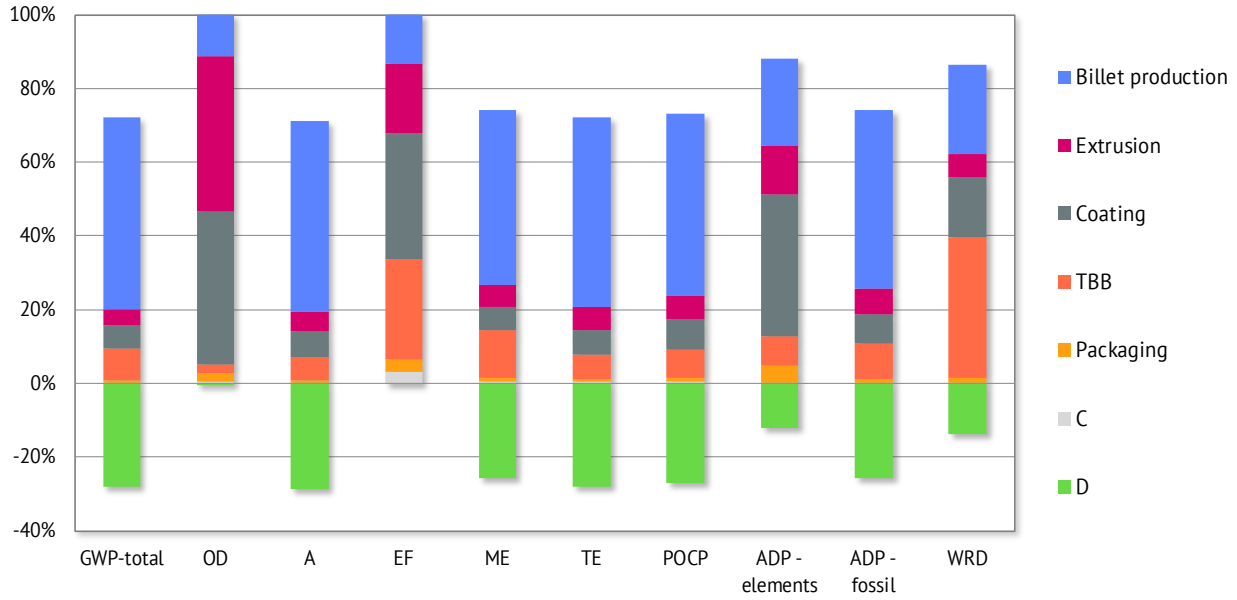
COATED ALUMINIUM PROFILE



THERMAL BREAK ANODIZED ALUMINIUM PROFILE



THERMAL BREAK COATED ALUMINIUM PROFILE



TBB inclusion, either in anodized or coated profile, does not affect the overall result in relation to the coated and anodized profiles. The TBB presence replaces part of the aluminium in profile. Not only less starting aluminium is used (as raw material) but also it is necessary to extrude less amount of profile, or anodize or coat less aluminium surface. This explains the slight decrease in some impacts categories of thermal break aluminium profiles in relation to the coated and anodized profiles.

It is also noteworthy that the presence of plastic components in the profile (powder coating and/ or TBB) reduces the useful amount of aluminium to be recycled at the end of life (the avoided impacts are reduced - module D-) and it supposes a greater problem in the landfill (increasing impacts reported in C4). However, module D is in all cases a very significant reduction in all indicators due to the replacement of primary aluminum.

VERIFICATION

This declaration is an environmental product declaration (EPD) in accordance with ISO 14025 and the requirements given in the product category rules document for Construction Products and Construction Services (EN 15804) and the general program guidelines by The International EPD® System. The results shown in this EPD are based on the LCA report for sector EPD of the Spanish Association of Aluminium of April 12, 2020 according to standard 14044.

This EPD is not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages or are based on different Product Category Rules. EPDs of construction products may not be comparable if they do not comply with EN 15804. This DAP is not representative of any particular manufacturer or any of its products; on the other hand, it is the average of the products manufactured by the members of the AEA.

The EPD owner is responsible for its content, as well as to preserve supporting documentation during the period of validity that justifies the data and statements that are included.

EPD Programme	The International EPD® System EPD International AB Box 210 60 SE-100 31 Stockholm Sweden www.environdec.com info@environdec.com
EPD registration number	S-P-01409
EPD owner	Asociación Española del Aluminio y Tratamientos de Superficie
Declared unit	1 kg of coated aluminium profile, anodized aluminium profile, thermal break coated aluminium profile and thermal break anodized aluminium profile
System boundaries	Cradle to gate with options
Published	2018 - 10 - 31
Revision date	2020 - 04 - 27
Valid until	2025 - 04 - 27
Reference year for data	2017
Geographical scope	Wordwide
Product group classification	UN CPC Code: 41532 Bars, rods and profiles, of aluminium
Product Category Rules	PCR 2019:14 v1.0 Construction products and Construction services. Based on CEN standard 15804:2012+A2:2019
PCR review was conducted by	Technical Committee of The International EPD® System
Independent verification of the declaration and data, according to ISO 14025:2006	[X] External [ ] Internal [ ] EPD®
